

Adding and removing SSO users

The [SSO class](#) reads user groups saved under the key `sso_groups` in `global/overlay/etc/hiera/data/common.yaml`.

So to add/remove a single user simply edit the relevant group.

Each instance of the SSO class will have a different set of allowed user groups, specified via class parameter "groups".

After the group list has been edited the Docker container `sso` needs to be restarted for the changes to take effect:

```
systemctl restart sso.service
```
