

# FW CNaaS Address-book

## General rules

Addresses are always FQDN-v4 or v6, for example office-pfx-v4

The addresses are then added to an address-set:

```
address-set office-pfx {  
    address office-pfx-v4;  
    address office-pfx-v6;  
}
```

That address-set can then be added to a larger address-set that should have a function name, for example offices

## SUNET specific addresses

Sunet specific addresses always start with SUNET-, for example SUNET-infra-cpe-mgmt-links
