

Example of a standard attribute resolver for Shibboleth IdP v5 and above

This is an example of a standard attribute resolver for SWAMID 2.0 in a Shibboleth IdP which contains definitions of all attributes defined in SWAMID's [Entity Category attribute release in SWAMID](#). Check the comments in the XML and replace any values as needed. Furthermore, check that you read the attributes from the correct data source.

The latest published SWAMID example standard resolver for Shibboleth Identity Provider is published at <https://mds.swamid.se/entity-configurations/Shibboleth-IdP/v4/attribute-resolver.xml>. Below is the latest version included from the publication repository.

The repository is in the process of being re-tagged for IdPv5. The v4 files work just fine with IdPv5.

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
  This file is an EXAMPLE configuration file for use within the
  SWAMID federation containing lots of example attributes, encoders,
  and a couple of example data connectors.

  Not all attribute definitions or data connectors are demonstrated, but
  a variety of LDAP attributes, some common to Shibboleth deployments and
  many not, are included.

  Deployers should refer to the Identity Provider documentation

  https://wiki.shibboleth.net/confluence/display/IDP4/AttributeResolverConfiguration

  for a complete list of components and their options.
-->
